Sequence 2178, Application US/09880107

Patent No. US2002012981A1

GENERAL INFORMATION:

APPLICANT: Horne, Darci T.

APPLICANT: Gene Logic, Uweeph G.

APPLICANT: Scherf, Uwe

APPLICANT: Gene Logic, Enc.

TITLE OF INVENTION: Gene Expression Profiles in Liver Cancer

TITLE OF INVENTION: Gene Expression Profiles in Liver Cancer

FILE REFERENCE: 44921-5028-WO

CURRENT APPLICATION NUMBER: US 60/214,379

PRIOR APPLICATION NUMBER: US 60/211,379

PRIOR FILING DATE: 2000-10-02

NUMBER OF SEQ ID NOS: 3950

SOFTWARE: Patentin Ver. 2.1

SEQ ID NO 2178

LENGTH: 3394

TYPE: DNA

TYPE: DNA

CORMANDEN: Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov
Series: Plate: Row: Column: 0
This clone was selected for full length sequencing because it
passed the following selection criteria: matched mRNA gi: 13937350
This clone has the following problem: frame shifted.

WPI; 2002-354068/39 N-PSDB; AAL46062.

An isolated nucleic acid molecule for the treatment of angiogenesis-related disorder, such as cancers or diabetic retinopathy, encodes an endostatin protein.

Claim 14; Fig 3; 56pp; English.

The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosis of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriasis, retinopathy, macular degeneration,

The present invention relates to a new method of producing a protein, and the present inventional protein domain, that is either C- or N-terminus of the puch as functional protein domain, that is either C- or N-terminus of the privary translational product (PTP) of a gene, where the profein has beloaded a regular tory DNA and a DNA targeting segment. This method is comprising a regularory DNA and a DNA targeting segment. This method is useful for producing a functional protein domain of proteins such as regularory blood products and monoclonal antibodies. The method described in the invention allows controlled and precise modification of the host cell genome in order to produce functional protein domain (FPD). The amount of exogenous sequence to be integrated in the host cell genome itself is used. Use of the host cell genome itself is used. Use of the host cell sequence encoding sequence, the original coding sequence present in the host cell genome itself is used. Use of the host cell sequence encoding sequence, the original coding sequence can also making use of the same post-transcriptional (e.g., splicing) and/or post-translational (e.g., splicing) processes that are complementary but coding for the maturation of FPD. The use of a single complementary but coding for the maturation of FPD. The use of a single complementary but coding for the expression vector. The present amino acid sequence represents the plasmid pEnd-HR#1 FPD fusion protein of the invention. This fusion protein contains the mouse Ig signal peptide in two forms as 4.1 of the human COLIBAL sequence (mIGSP) sequence tused to exone 38-41 of the human COLIBAL sequence
                                                                                                                       Producing functional protein domain by growing host cell transfected with DNA construct having regulatory DNA and DNA targeting segment, and optionally culturing homologously recombinant cell and collecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          166
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                51 PWRADDILLASPPRLPEPOPYPGAPHHSSYVHLRPARPTSPF----AHSHRDFOPVLHLVA 106

Producing functional protein domain by growing host cell transfected with DNA construct having regulatory DNA and DNA targeting segment, and optionally culturing homologously recombinant cell and collecting protein. WPI; 2002-195963/25.

Example; Fig 3; 116pp; English.

The present invention relates to a new method of producing a protein, such as functional protein domain, that is either C or N-terminus of the primary translational product (PTP) of a gene, where the protein has biological activity which is distinct from PTP. The method of the invention involves growing a host cell transfected with a DNA construct comprising a regulatory DNA and a DNA targeting segment. This method is useful for producing a functional protein domain of proteins such as regulatory factors, blood products and monoclonal antibodies. The method described in the invention allows controlled and precise modification of the host cell genome in order to produce functional protein domain (FPD). The amount of exogenous sequence to be integrated in the host cell genome is used. Use of the host cell genome is every limited since, as coding sequence, the original coding sequence present in the host cell genome itself is used. Use of the host cell genome tiself is used. Use of the host cell genome treation of such ording sequence are encoding FPD also provides the advantages of both eliminating making use of the same post-transcriptional (e.g., splicing) and/or post-translational (e.g., splicing) and or post-translational (e.g., splicing) and or post-translational (e.g., splicing) and or complementary but coding for the maturation of FPD. The use of a single regulatory unit eliminates the necessity of manipulating the complementary but coding for the EPPD and adapt it to the expression vector. The segment coding for the FPD, and coding for the protein domain used to illustrate the method of the invention

Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases. The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polymuclectides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen of polymuclectides, antibodies against human ovarian antigens, and the use of ovarian antigen polymuclectides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related Claim 11; SEQ ID NO 3010; 2922pp; English. WPI; 2002-147878/19. N-PSDB; ABQS4955.

disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system disorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian cysts, and dysmenorrhoea), endocrine disorders, infections (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatorry conditions (e.g., mascritis, ophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood related disorders (e.g., ansemia), cardiovasoular disorders, cepticatory disorders and used also be used in screening for compounds which modulate ovarian antigen by pression or activity. The polymucleotides may further be used for gene therapy, chromosome mapping, in the conflict dentification of individuals and in forensic analysis, and the polymorleotides may be used as food additives or to prepare antibodies useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequence

Diagnosis and monitoring of liver disease by measuring collagen type XVIII levels - with elevated levels indicative of disease, especially cirrhosis or hepatocellular carcinoma.

Example 6; Fig 8; 56pp; English

A method has been developed for the detecting liver disease. The method comprises: (a) reacting a patient sample with antibodies (Ab) specific for collagen type XVIII (coll8); (b) measuring the amount of Ab-antigen complex (C) formed as indicator of the amount of Coll8 present; (c) similar analysis of a non-diseased control; and (d) comparing the amounts of Coll8 in the two samples to detect presence or progression of disease. Elevated levels of Coll8 are: (i) indicative of disease, specifically cirrhosis; and (ii) predictive of the prognosis of disease, specifically hepatocellular carcinoma (there is a relationship between Coll8 mRNA levels and tumour size and necrosis, and survival times are significantly higher in patients with higher Coll8 levels). The method provides non-livasine, early and accurate diagnosis of liver disease. The present sequence represents the sequence common to human alpha-1 (XVIII) collagen chain from the present invention

                                                                                                                                                 The present invention describes a humanised baculovirus (I) which comprises a modified baculovirus genome having a nucleic acid molecule encoding a therapeutic agent and a polypeptide which functions to target the baculovirus to at least one cell type. Also described is a not an be used in gene therapy. The baculovirus is useful in the manufacture of a medicament for the treatment of cancer, particularly protein, which is specified in the exemplification of the present sequence represents the human endostatin protein, which is specified in the exemplification of the present invention. N.B. The present sequence is not given in the specification but is referred to in Claim 24 as Genbank accession number NM_130445

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-anglogenic polypeptide chosen from human or murine encoding an anti-anglogenic polypeptide chosen from inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-anglogenic pypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-anglogenic polypeptide inhibits anglogenesis in the vicinity of the retina. The vector is administered to cells ex vivo and then administered to the patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 180

The invention relates to an isolated polymucleotide (1) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (c) sequences consisting of at least 20 contiguous residues of (a); (d) sequences consisting of at least 20 contiguous complements of (a); (d) sequences that hybridize to (a), under moderately to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596 to (a) a patient conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP68596 to any abtient and compositions comprising polypeptides (ABP68596 to any attient and compositions comprising polypeptides to presenting calls between the polypeptide are useful in treating penceatic cancer and simulating an immune response. The polymucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and proteins in the tumour cells, in vaccines and for gene therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly verver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1348 INSPLSGOMRGIRGADFOCFOQARAVGLAGTFRAFLSSRLODLYSIVRRADRAVFIVNL 1407

                                                                                                                                                                                                                              comprising a DNA encoding an anti-anglogenic protein, which shows therapeutic effects on rheumatoid arthritis. The composition is useful for treating rheumatoid arthritis and the gene therapy is effective, lasting for 14 days. The present sequence is the protein sequence for human collagen XVIII. Endostatin, which consists of the C-terminal 183 residues of collagen XVIII, was used as an anti-anglogenic protein

Nucleic acid encoding human alpha-1 collagen - for production of recombinant alpha-1 collagen, for use in the treatment of cartilage Claim 1; Col 23-30; 35pp; English. 93US-00159784. 93US-00159784 (HARD) HARVARD COLLEGE WPI; 1997-350247/32. N-PSDB; AAT84484. oh SP; degeneration. 01-DEC-1993; 01-DEC-1993; US5643783-A. Olsen BR,

Novel human type alpha-1 (XVIII) collagen is characterised by 10 triple helical domains containing the GXYGX'Y' motif (where X, Y, X' and Y' represent any amino acid), the helical domains being separated and flanked by non-triple helical regions which may provide flexibility. Alpha-1 collagen is expressed in multiple tissues, especially liver, lung and kidney. A claimed plasmid comprising alpha-1 collagen nucleic acid (see AAT84484) and an expression control sequence can be used to express recombinant collagen in prokaryotic or eukaryotic (especially mammalian) host cells. The alpha-1 collagen may be used to treat a patient suffering from a disease associated with cartilage degradation, and for supplementing collagen. It can also be used as a connective tissue filler (e.g. for plastic surgery), can be interposed between a dermal equivalent

In vitro diagnosis and monitoring of endometriosis, comprises detecting reduced expression of specific gene products, e.g. from the fibronectin

Claim 1; Page 12-13; 21pp; German.

The present invention relates to a method for the in vitro diagnosis of endometriosis by determining the amount of gene product from at least one specific gene in a patient sample and comparing this with the amount of gene product in a patient sample and comparing this with the amount of endometriosis. The gene products may be fibronectin, p27, reticulocalbin, albulin-like growth factor binding protein-2, alpha-2 type IV collagen, transmembrane receptor PRTA, collagen type XVIII alpha 1, platelet transmembrane receptor receptor alpha, laminin M chain, subtlisin like protein PACE4 or nidogen. The method is useful for initial diagnosis of endometriosis, and also for monitoring progress and treatment of the disease. The present sequence is human collagen type XVIII alpha 1

                                                                                                                                                                          Peptide
                                                                                                                                                                                                                                      Peptide
This invention describes a novel method for identifying mimetics of mammalian endostatin. The method comprises identifying a compound having atomic coordinates with non-trivial similarity to selected coordinates of atomic coordinates of atomic coordinates of atomic coordinates of atomic coordinates of atomic coordinates of atomic coordinates of compounds in a library of candidate compounds, (b) comparing the library of atomic coordinates of a mammalian endostatin and (c) selecting from the library at least one candidate compound on the basis of selection criteria which include similarities between the atomic coordinates of the selected candidate compound and the atomic coordinates of the mammalian endostatin. The invention also describes the use of an anti-angiogenic fragment of endostatin comprising a domain selected from a heparin binding domain, are receptor binding domain, and exposed on alpha helix A domain, and a carbohydrate recognition domain (CRD) domain. The methods can be used for designing and and selecting endostatin mimics. The compounds identified can be used for treating undesired angiogenesis, e.g. tumours. This sequence the second process of the compounds identified can be used for treating undesired angiogenesis, e.g. tumours. This sequence

ä

A method has been developed for the detecting liver disease. The method comprises: (a) reacting a patient sample with antibodies (Ab) specific for collagen type XVIII (Coll8); (b) measuring the amount of Ab-antigen complex (C) formed as indicator of the amount of Coll8 present; (c) similar analysis of a non-diseased control, and (d) comparing the amounts of Coll8 in the two samples to detect presence or progression of disease. Elevated levels of Coll8 are: (i) indicative of disease, specifically hepatocellular carcinoma (there is a relationship between Coll8 mRNA levels and tumour size and necrosis, and survival times are significantly higher in patients with higher Coll8 levels). The method provides noninvasive, early and accurate diagnosis of liver disease. The present sequence represents the sequence common to mouse alpha-1 (XVIII) collagen Diagnosis and monitoring of liver disease by measuring collagen type XVIII levels - with elevated levels indicative of disease, especially cirrhosis or hepatocellular carcinoma. chain from the present invention Example 6; Fig 8; 56pp; English

The present invention provides the protein and coding sequences of canine pro-endostatin and endostatin. The sequences can be used in the treatment and diagnosts of angiogenesis related disorders, including cancer, rheumatoid arthritis, psoriasis, retinopathy, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, nubosais, obler whebber Syndrome, wyocardial angiogenesis, plaque neovascularisation, telangiectusia, haemophiliac joints, angiofibroma, wound granulation, coronary collaterals, cerebral collaterals, arteriovenous malformations, isohaemic limb angiogenesis, diabetic neovascularisation, and fractures. The present sequence is the canine pro-endostatin protein sequence Claim 14; Fig 5; 56pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 HSHRDFQPVIHLVALNSPLSGGWRGIRGADFQCPQQARAVGLAGTFRAFLSSRLQDLYSI 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 2, Application US/09206059

Patent No. 6201104

GENERAL INFORMATION:
APPLICANT: MacDonald, Nicholas
APPLICANT: Sim, Kim Lee
TITLE OF INVENTION: Anglogenesis-Inhibiting Protein Binding Peptides and
TITLE OF INVENTION: Proteins and Methods of Use
PILE REFERENCE: 05213-0370
                                           1 HSHRDFOPVLHLVALNSPLSGGMRGIRGADFOCFQQARAVGLAGTFRAFLSSRLQDLYSI
